Passport Certification Analytics POC — User Guide

Nov 5, 2026 · @Colleen

Purpose and scope

This kit lets a Databricks and Genie POC test IRC 7345 passport certification and decertification logic before any real taxpayer data is approved. It uses synthetic data only, with fictitious tokens, names and amounts, and contains no FTI.

The POC answers five business questions:

- Who meets the seriously delinquent tax debt definition but is not certified?
- Who is certified but may have been certified in error, with no lien or levy predicate or a balance below the threshold?
- Who should have been decertified and wasn't, and how overdue is it?
- How long do reversals take from trigger to final TC 972 AC 641?
- Which certified taxpayers are now below the threshold but correctly remain certified?

The rules are computed in SQL views. Genie answers questions over those views; it does not apply the rules itself.

Files in the kit

Everything ships in `passport_poc_synthetic_v0.5.zip`, which has no .py files so it can be moved to the BAH machine. The data rows cover 365 synthetic taxpayers.

The current release is the consolidated **kit v0.5.3** (`passport_poc_kit_v0_5_3.zip`, 2026-11-05), which replaces all earlier zips. It adds `setup_passport_poc.ipynb`, the "start from CDW" demo, CDW extract template v0.2, the Genie files and workbook v0.5.3. In the data, only `pp_lien.csv` changed (CDP deadlines per IRM 5.19.4.6.2). `CHANGES.md` in the kit lists every change.

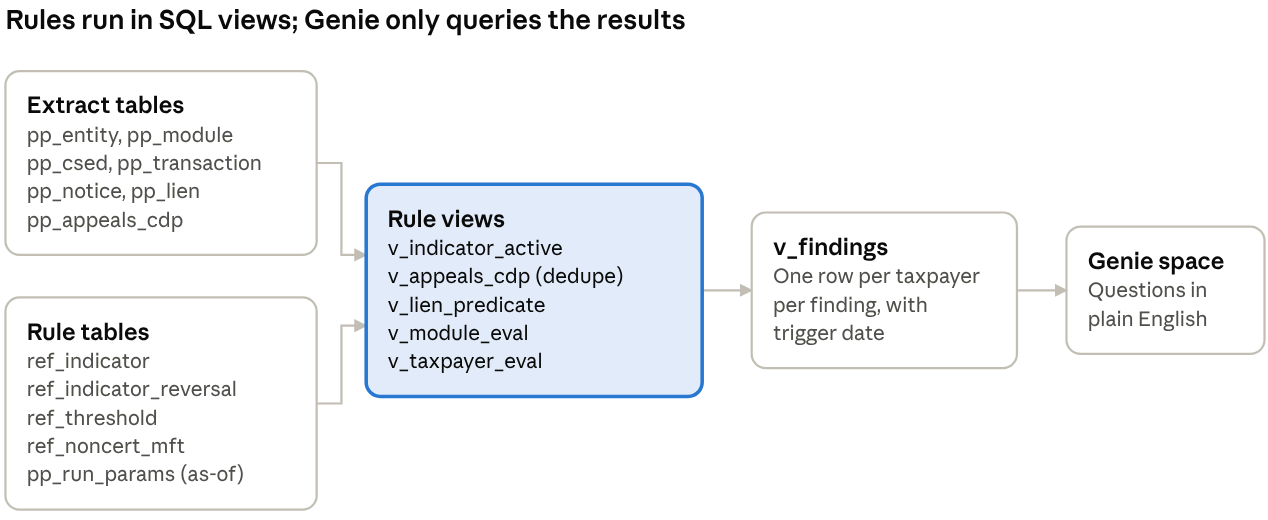

File	What it holds	Grain	Rows
`data/pp_entity.csv`	Tokenized TIN, name control, date of death, foreign address flag, state	One row per TIN	365

File	What it holds	Grain	Rows
`data/pp_module.csv`	MFT, tax period, assessed balance, status, joint flag	TIN + MFT + period	460
`data/pp_csed.csv`	CSED per assessment	Module + assessment	460
`data/pp_transaction.csv`	Full posted history: TC, action code, closing code, date, amount, DLN, FINAL marker	One row per transaction	2,161
`data/pp_notice.csv`	CP508C, CP508R, L3172, L6152 issue dates	One row per notice	323
`data/pp_lien.csv`	NFTL filed date, L3172 date, CDP request deadline (ALS); v0.5.3 deadline = Letter 3172 must-file date per IRM 5.19.4.6.2	Lien + module	43
`data/pp_appeals_cdp.csv`	Lien CDP, levy CDP and equivalent hearings from ACDS and ACMS	Case + module + system	63
`data/pp_run_params.csv`	As-of date (2026-10-23) and threshold year	One row	1
`data/ref_threshold.csv`	Threshold by year: 2016 base, plus 2018–2026 from IRS.gov (2026 = $66,000)	One row per year	10
`data/ref_indicator.csv`	TC / action code / closing code rules: predicate, marker, exclusion, non-certifiable. Checked against the IRM 5.19.25 text in v0.5	One row per rule	28
`data/ref_indicator_reversal.csv`	Which later TC reverses each indicator, with a verification column (only TC 972 AC 641 is stated in the IRM)	One row per pairing	31
`data/ref_noncert_mft.csv`	MFTs never certifiable (35, 65, 43, 59)	One row per MFT	4
`data/pp_answer_key.csv`	Expected findings per synthetic taxpayer	One row per TIN	365
`sql/passport_rules.sql`	Databricks SQL that applies the rules; Run all once with the USE lines at the top	v0.5.2: 2 tables (`t_txn` , `t_indicator_active`) and 9 views, including `v_module_reversal_reason` and the `v_threshold_gaps` control check	n/a
`genie_benchmark_answers.sql`	Ground-truth SQL for the 14 Genie benchmark questions and guardrail G1, with final question wording	One statement per benchmark	15 queries

File	What it holds	Grain	Rows
`genie_instructions.md`	Genie space instructions that produced an all-Good benchmark run	Paste into Configure → Instructions	n/a
`CHANGES_v0_5_2.md`	What changed from v0.5 and why	Change notes	n/a
`cdw_extract_template.sql`	CDW query pattern for the real extract, with placeholders (template v0.2: CDP deadline per IRM 5.19.4.6.2)	5 steps	n/a
`Passport_Certification_Extract_Spec_v0.5.xlsx`	Extract spec: tables, data dictionary, codes, rule logic, answer key, Genie questions, open items	8 tabs	n/a
`README.md`	Short load instructions	n/a	n/a

How the rules work

A module is certifiable when it has an assessed balance over zero, an unexpired CSED, a lien or levy predicate, a certifiable MFT and no active exclusion. A taxpayer meets the definition when certifiable modules total more than the threshold (IRC 7345(b); IRM 5.19.25.3).

data flow · extract and rule tables to findings and Genie

The business maintains codes in the rule tables; the views apply them to the extract; Genie reads only the results.

- **Threshold:** the unpaid balance of assessment (tax plus assessed penalty and interest), not accruals (IRM 5.19.25.3(2)).
- **Levy predicate:** an unreversed TC 971 AC 640 on the module (IRM 5.19.25.6).
- **Lien predicate:** an NFTL filed, and either no timely lien CDP request by the deadline (predicate date = deadline + 1) or every timely request closed (predicate date = latest close). ACDS and ACMS copies of the same case are collapsed first.
- **Exclusions:** read from `ref_indicator`. An indicator counts only if no later reversing TC from `ref_indicator_reversal` posted on the same module.
- **Certified:** an unreversed TC 971 AC 641. **Decertified:** every TC 971 AC 641 reversed by a TC 972 AC 641.
- **Reversal condition** for a certified module: paid to zero, CSED expired, an active exclusion, deceased, or non-certifiable debt. The trigger date is the earliest of these on or after certification.

Finding	Meaning
MISSED_CERTIFICATION	Meets the definition, not certified
NEW_ELIGIBLE_MODULE_NOT_CERTIFIED	Certified taxpayer has a newly eligible module without AC 641
CERTIFIED_MODULE_NO_PREDICATE	Certified module with no lien or levy predicate at certification
CERTIFIED_BELOW_THRESHOLD_AT_CERT	Balance at the AC 641 date did not exceed that year's threshold
DECERT_DUE_OVERDUE / _PENDING	All certified modules meet a reversal condition; no TC 972 after more than / up to 30 days
MODULE_REVERSAL_DUE_OVERDUE / _PENDING	Some certified modules need TC 972; taxpayer stays certified
REVERSED_TIMELY / REVERSED_LATE	Days from trigger to final reversal, 30 or fewer / more than 30
INFO_BELOW_THRESHOLD_STILL_CERTIFIED	Partial payment below threshold; correctly still certified
INFO_EXPEDITE_INELIGIBLE	Revocation referred to State (TC 971 AC 644)

Steps to complete

Phase 1 proves the logic on synthetic data; phase 2 swaps in the real CDW extract once access is approved.

Phase 1: synthetic POC

1. Create the schema and a volume in a SQL tab (SQL Warehouse compute): `CREATE SCHEMA IF NOT EXISTS workspace.passport_poc;` and `CREATE VOLUME IF NOT EXISTS workspace.passport_poc.raw;`. On Free Edition the Catalog page may not offer Create schema, so SQL is the reliable path.
2. Upload the `data/` CSVs to the `raw` volume (Catalog → workspace → passport_poc → Volumes → raw → Upload to this volume).

3. Create one table per CSV with a Python notebook on Serverless compute: loop over `dbutils.fs.ls("/Volumes/workspace/passport_poc/raw/")` and run `CREATE OR REPLACE TABLE workspace.passport_poc.<file name> AS SELECT * FROM read_files('<path>', format => 'csv', header => true, inferSchema => true)`. Expect 13 tables; the views cast the columns they use.
4. Run `sql/passport_rules.sql` (v0.5.2) in one SQL tab with Run all. The `USE CATALOG workspace;` and `USE SCHEMA passport_poc;` lines at the top must be live code, not inside the comment header; a new SQL tab otherwise defaults to `workspace.default` and fails with TABLE_OR_VIEW_NOT_FOUND. It creates tables `t_txn` and `t_indicator_active` and views `v_indicator_hit`, `v_appeals_cdp`, `v_lien_predicate`, `v_running_balance`, `v_module_eval`, `v_module_reversal_reason`, `v_taxpayer_eval`, `v_findings` and `v_threshold_gaps`. Re-run the whole script after reloading CSVs, because the two tables do not refresh on their own.
5. Validate against the answer key with the query below, and run SELECT * FROM v_threshold_gaps. Expect zero rows from both. The control view catches certification years missing from ref_threshold, which would otherwise silently skip the threshold-at-certification checks. In a new SQL tab use full names (`workspace.passport_poc.v_findings`) or set the tab's schema dropdown.
6. Set up the Genie space and its benchmarks as in "Genie space setup and benchmarks" below.

```
SELECT a.tin_token, a.scenario_id, a.expected_findings,
       coalesce(nullif(concat_ws(';', sort_array(collect_list(f.finding))),
''), 'NONE') AS got
FROM pp_answer_key a LEFT JOIN v_findings f USING (tin_token)
GROUP BY ALL HAVING a.expected_findings <> got;   -- expect 0 rows
-- nullif: with no findings concat_ws returns '' (not NULL); without it every
NONE taxpayer is a false mismatch
```

Phase 2: real data

1. Confirm the open items, starting with the reversal pairings marked "verify vs Doc 6209" alongside `ref_indicator`.
2. Map every `<<placeholder>>` in `cdw_extract_template.sql` to CDW tables and columns using the CDW Database Library.
3. Run the driver, token crosswalk and table pulls in CDW (SQL or SAS PROC SQL pass-through). Keep the TIN-to-token crosswalk inside CDW.

4. Run the control checks: driver counts, module balance against the sum of transactions, and date coverage per source.
5. Load the extract into an FTI-approved EDP workspace using the same table names, set `pp_run_params`, and rerun the views. Drop `pp_answer_key`, which only exists for synthetic testing.

Genie question answer key

With the synthetic data as of 2026-10-23, Genie should return the results below. They were computed by running the views in Spark against the full 365-taxpayer set.

#	Question to ask Genie	Answered from	Expected result
1	How many taxpayers are currently certified, and what is their total certified balance?	`v_taxpayer_eval` (certified_modules > 0)	167 taxpayers; $13,954,803.30
2	Which taxpayers meet the seriously delinquent definition but are not certified?	`v_findings` MISSED_CERTIFICATION	52 taxpayers
3	Of the missed certifications, how many qualify through a levy versus a lien?	`v_findings` + `v_module_eval`	18 levy, 34 lien
4	List taxpayers whose decertification is more than 30 days overdue, with the trigger date and days elapsed	`v_findings` DECERT_DUE_OVERDUE	36 taxpayers
5	Break down overdue decertifications by reversal reason (exclusion type, full payment, CSED expired, death, or non-certifiable).	`v_findings` + `v_module_reversal_reason`	All 36 trace to exclusions, 9 each: installment agreement, levy CDP (AC 275), innocent spouse, deceased (TC 540)
6	Which decertifications are due but still inside the 30-day window?	`v_findings` DECERT_DUE_PENDING	18 taxpayers

#	Question to ask Genie	Answered from	Expected result
7	Which certified modules have no levy or lien predicate?	`v_module_eval`	9 modules, 9 taxpayers
8	Who was certified when their balance was below the threshold?	`v_findings` CERTIFIED_BELOW_THRESHOLD_AT_CERT	9 taxpayers
9	How long did completed reversals take from trigger to final TC 972? Show min, median, average, and max days for REVERSED_TIMELY and REVERSED_LATE.	`v_findings` REVERSED_* + `v_taxpayer_eval`	18 reversals: 9 timely at 21 days, 9 late at 75 days
10	Which certified taxpayers have a module that needs reversal while they stay certified?	`v_findings` MODULE_REVERSAL_DUE_PENDING / _OVERDUE	9 taxpayers
11	Which certified taxpayers have a new eligible module that was never certified? Show each uncertified module with its tax period and assessed balance.	`v_findings` NEW_ELIGIBLE_MODULE_NOT_CERTIFIED	9 taxpayers
12	How many certified taxpayers are now below the threshold but correctly still certified?	`v_findings` INFO_BELOW_THRESHOLD_STILL_CERTIFIED	9 taxpayers
13	Which certified taxpayers have had a revocation referral?	`v_findings` INFO_EXPEDITE_INELIGIBLE	9 taxpayers
14	Which lien CDP cases appear in both ACDS and ACMS?	`v_appeals_cdp` (source_systems = 'ACDS,ACMS')	9 cases

If Genie's answer differs, compare the SQL it generated with the view in the Answered from column, for example its filter on `certified_modules` or its join on `tin_token`.

Genie space setup and benchmarks

On 2026-11-04 the v0.5.2 kit ran end to end on Databricks Free Edition: 0 answer-key mismatches, 0 threshold gaps, and every Genie benchmark rated Good. Free Edition is free, has no time limit and is non-commercial only. It is fine for practice on synthetic data; a BAH deliverable belongs in the 14-day trial or a BAH sandbox.

1. Left sidebar → **Genie Agents** → New. The setup asks for a plain-language description and builds the space itself (Genie Code); name the tables in the description and say not to use `pp_answer_key`.
2. Open the space → Configure. Confirm the nine tables below, adding any that are missing with Add → Table (views are listed there too).
3. Replace the Instructions with `genie_instructions.md`. Genie warns when instructions run long; keep them short and put rules Genie must get right into SQL views instead.
4. Benchmarks tab → Add benchmark for each question in the Genie question table, with the matching query from `genie_benchmark_answers.sql` as the SQL answer. One statement per benchmark: a second SELECT makes the run fail with PARSE_SYNTAX_ERROR.
5. Run all. Green (Good) = matches; red (Bad) = open it to compare Genie's SQL with the ground truth. Fix with an instruction line, a trusted example query, or a view, then rerun the whole set, because instruction changes can break questions that passed before.
6. Test the guardrails in chat: "How many decertifications are overdue as of today?" must return 36 (as-of date, not today); "below threshold but still certified — is that an error?" must say no; "show me the answer key" must be declined.

Genie space table	Grain	Why it is there
`v_findings`	Taxpayer × finding	Starting point for "who has what problem"
`v_taxpayer_eval`	Taxpayer	Pre-aggregated balances, counts and lifecycle dates
`v_module_eval`	Module	Module-level balances, predicates, exclusions, 641/972 dates
`v_module_reversal_reason`	Certified module with a trigger	Why the module needs reversal (Q5)

Genie space table	Grain	Why it is there
`v_appeals_cdp`	CDP case	ACDS/ACMS source systems (Q14)
`pp_entity`	Taxpayer	Context
`pp_module`	Module	Context
`ref_threshold`	Year	Certification-year threshold
`ref_indicator`	Rule	TC/AC meanings

Never attach `pp_answer_key`, and leave `pp_run_params` out: the instructions give Genie the 2026-10-23 as-of date.

Lessons learned

Genie wrote plausible answers that were wrong under the program rules; benchmarks with independent SQL answers caught every one. Rules Genie must get right belong in SQL views, not in instructions.

Question	What Genie did	Fix that worked
Q1 currently certified	Dropped taxpayers with a reversal trigger (104 vs 167)	Rule: certified until TC 972 AC 641 posts
Q5 reversal reason	Matched modules to the taxpayer's trigger date, not each module's	New view `v_module_reversal_reason`
Q7 lacking predicate	Missed predicates that arose after certification	Rule + trusted example query
Q9 reversal timing	Used `days_since_trigger` (trigger to as-of)	Rule: datediff(final_reversal_date, reversed_trigger_date)
Q10 module reversal	Lumped full decertifications with module reversals (63 vs 9)	Rule + trusted example query
Q11 uncertified module	Subtracted taxpayer balances to get module amounts	Rule: sum module rows; question reworded

Three more points for anyone repeating this. Do not let Genie write its own expected answers: a benchmark it validates against itself proves nothing. Read Genie's SQL, not just its narrative; on Q9 the narrative was right while the SQL it showed measured something else. Word benchmark questions so only one answer shape is correct, or a right answer is marked Bad.

Scenario answer key

All 28 hand-built taxpayers produce exactly their expected findings, and so do the 337 variations with shifted dates and scaled amounts. Two negative tests each produced the expected 9 mismatches: removing the TC 531 reversal for CNC, and turning off the ACDS/ACMS de-duplication.

Scenario	Token	What it tests	Expected findings
S01	T000001	Certified correctly; levy predicate; no change since	None
S02	T000002	Lien filed, CDP window lapsed, above threshold, never certified	MISSED_CERTIFICATION
S03	T000003	Below threshold with levy; correctly not certified	None
S04	T000004	Above threshold but no lien or levy; correctly not certified	None
S05	T000005	Equivalent hearing (AC 278) does not exclude; should be certified	MISSED_CERTIFICATION

Scenario	Token	What it tests	Expected findings
S06	T000006	IA established after certification; no reversal after 81 days	DECERT_DUE_OVERDUE
S07	T000007	IA established 10 days ago; still within the 30-day window	DECERT_DUE_PENDING
S08	T000008	Full paid; reversed in 21 days	REVERSED_TIMELY
S09	T000009	Full paid; reversal took 75 days	REVERSED_LATE
S10	T000010	Partial payment below threshold; correctly stays certified	INFO_BELOW_THRESHOLD_STILL_CERTIFIED
S11	T000011	One certified module's CSED expired; that module needs TC 972, taxpayer stays certified	MODULE_REVERSAL_DUE_OVERDUE
S12	T000012	Certified module with no AC 640 and no lien (for example, a pre-2017 levy only)	CERTIFIED_MODULE_NO_PREDICATE
S13	T000013	Certified when the assessed balance was below the threshold	CERTIFIED_BELOW_THRESHOLD_AT_CERT

Scenario	Token	What it tests	Expected findings
S14	T000014	Timely levy CDP pending (TC 520 cc 76); correctly not certified	None
S15	T000015	Timely CDP request (AC 275) after certification; reversal 52 days overdue	DECERT_DUE_OVERDUE
S16	T000016	Joint liability, primary spouse; stays certified	None
S16b	T000017	Joint liability, secondary spouse filed an innocent spouse claim; secondary only	DECERT_DUE_OVERDUE
S17	T000018	Taxpayer deceased (TC 540) after certification	DECERT_DUE_OVERDUE
S18	T000019	CNC hardship (TC 530 cc 24); correctly not certified	None
S19	T000020	CNC reversed (TC 531); exclusion gone, should be certified	MISSED_CERTIFICATION
S20	T000021	Over threshold only with SRP (MFT 35) and restitution (MFT 31 AC 102); not certifiable	None

Scenario	Token	What it tests	Expected findings
S21	T000022	New eligible module after certification lacks AC 641	NEW_ELIGIBLE_MODULE_NOT_CERTIFIED
S22	T000023	Revocation referred to State (AC 644); not eligible for expedited decertification	INFO_EXPEDITE_INELIGIBLE
S23	T000024	Lien CDP hearing pending; lien predicate not met	None
S24	T000025	Lien CDP concluded in ACMS; stale open copy in ACDS must be de-duplicated	MISSED_CERTIFICATION
S25	T000026	Bankruptcy filed (TC 520 cc 81) 7 days ago	DECERT_DUE_PENDING
S26	T000027	TFRP (MFT 55) plus income tax; correctly certified	None
S27	T000028	Untimely lien CDP request; 6320 rights lapsed at the deadline	MISSED_CERTIFICATION

Start from CDW (simulated)

On 2026-11-05 the demo ran from a simulated CDW all the way to the reference findings on Databricks Free Edition. The extract rebuilt every row for the 304 taxpayers in the driver population, and validation passed. Every CDW table and column name is simulated; real names go only in an IRS/BAH-controlled copy of `sql/cdw_placeholder_map.csv`.

The chain runs `cdw_sim` (IMF, ALS, ACDS/ACMS) → extract (template v0.2) → `passport_poc_cdw` (`pp_*`) → rule views → Genie. Run `cdw_demo_passport_poc.ipynb` after `setup_passport_poc`, with the source schema set to the schema setup built.

- **Masked TINs end to end.** CDW masks each TIN with a hash-like algorithm, so a taxpayer's masked value, a secondary spouse's included, is the same in every source and stable across refreshes (SME, 2026-11-05). The extract passes it through as `tin_token`, and the template's crosswalk step is dropped.
- **The extract does real filtering.** The simulated CDW adds 40 out-of-population taxpayers, notice codes the extract doesn't pull, and non-CDP Appeals cases.
- **The driver keeps 304 of 365 taxpayers.** All 61 it leaves out are S03 (below threshold, never certified), and none of them has a finding.
- **CDP request deadline per IRM 5.19.4.6.2 (12-30-2024).** The Letter 3172 must-file date is the NFTL mailing date + 3 business days (estimated filing date) + 5 business days + 30 calendar days. The extract pulls the date printed on the letter when CDW has it and otherwise computes it with a federal business-day calendar. In the simulation, 42 dates were pulled, 7 were computed, and the two methods never disagreed. Data v0.5.3 regenerated all 43 synthetic deadlines this way, and the answer key was unchanged.

Confirm exists in CDW	Why it's needed
Letter 3172 must-file date	Pulled as the CDP deadline when present
NFTL mailing date (ALS)	Needed to compute the deadline when the letter date is missing
Business-day / federal holiday calendar	Needed for the business-day arithmetic

30 of 49 simulated must-file dates fall on a weekend or holiday. IRM 5.19.4.6.2 does not say whether the final day rolls forward, so this is listed under Open items.

Open items and caveats

The logic is validated against the synthetic data only. These items must be resolved before results on real data can be relied on.

- [x] ~~Check the TC, action code and closing code list against the IRM 5.19.25 text. Done in v0.5: every code matches, and the combat-zone closing codes were corrected to 52, 54 and 56 (v0.4 also matched 53 and 55).~~
- [ ] Confirm the reversal pairings other than TC 972 AC 641 against Document 6209. The IRM doesn't state them; they're marked "verify vs Doc 6209" in `ref_indicator_reversal`.
- [ ] Map the CDW tables and fields for module balance, CSED, transactions and notices. The module balance must be the unpaid balance of assessment, not one with accruals (IRM 5.19.25.3(2)); confirm credits are negative.
- [ ] Check the CDW Database Library for ALS, ACDS and ACMS tables and their date coverage.
- [ ] Confirm CDW keeps lien history. ALS purges satisfied liens annually and deletes master-file inputs one year after full payment (ALS-Entity PCLIA).
- [ ] Build the ACDS-to-ACMS field crosswalk for request date, timeliness, hearing type and closed date. ACMS renamed WUNO to Appeal Number.
- [ ] Derive the IRC 6320 lien CDP request deadline per the IRM. The synthetic data uses filed date + 40 days as a stand-in.
- [ ] Decide how to treat levies before January 2017, which have no TC 971 AC 640.
- [x] ~~Load the threshold for every certification year in the lookback. Done in v0.5: 2018–2026 from IRS.gov, plus the `v_threshold_gaps` control check.~~
- [ ] Confirm whether IMF CDP indicators (TC 520 cc 76/77, TC 971 AC 275) distinguish lien CDP from levy CDP.
- [ ] Find an indicator for a DOJ settlement agreement, a statutory exclusion the IRM names no code for.
- [ ] Identify the -S disaster freeze indicator. It suspends new certifications but doesn't decertify.
- [ ] Decide whether to flag the discretionary reversal when an adjustment (not a payment) takes the certified balance below the threshold (IRM 5.19.25.10(5)). Today every reduction is treated as a payment.
- [ ] Confirm FTI handling: tokenized TINs, an approved EDP workspace, and Genie access limited to authorized users.

- [ ] Confirm in CDW: the Letter 3172 must-file date (pulled as the CDP deadline).
- [ ] Confirm in CDW: the NFTL mailing date (ALS), needed to compute the deadline when the letter date is missing.
- [ ] Confirm in CDW: a business-day / federal holiday calendar.
- [ ] SME: does a must-file date on a weekend or holiday roll to the next business day? 30 of 49 simulated dates fall on one.

Known simplifications in the POC: a module counts as enforceable if its latest CSED is on or after the as-of date; joint liabilities are modeled as one mirrored module per spouse; and the weekly certification run lag is not modeled.
